**Abstract**---Schiff bases (2a-i) have been synthesized. Their chemical structures were characterized by IR, 1HNMR, 13C NMR and mass spectral analysis. The synthesized compounds were subjected to docking studies using Schrodinger Meastro 12.4. The results pointed out that compounds 2f,2h and 2c were explored superior inhibition activity with the protein 4OD9. Further, the results of QM studies of these synthesized compounds indicated the importance of weakly polar component of surface area, hydrophobicity and ionization potential parameters in defining their anticancer activity.

**Keywords**---Schiff bases, meastro 12.4, docking, anticancer activity.

**Introduction**

Schiff bases are condensation products of primary amines with carbonyl compounds. A common structural feature of these compounds is azomethine group with the general formula RHC=N–R1, where R and R1 are alkyl, aryl, cycloalkyl or heterocyclic groups, which may be variously substituted [1]. Several studies [2-4] showed that the presence of a lone pair of electrons in a sp2 Hybridized orbital of the nitrogen atom of the azomethine group is of considerable chemical and biological importance. Schiffbase compounds containing an imino group (C=N–) are potential anticancer drugs. Due to the straight forward preparation, synthetic flexibility and the special property of the C=N group, Schiff bases are generally excellent chelating agents [5,6], especially when a functional group like –OH is present close to the azomethine group. Schiff bases have also been reported to show biological properties, such as antibacterial and antifungal activities [7-9].

Cancer is the most common cause of mortality in most parts of the world[10] and currently is the most common impediment to achieving desirable life expectancy in most countries Breast cancer is one of the lethal diseases worldwide. According
to the Malaysia National Cancer Registry Report (MNCR 2007-2011), 17.7% from 103,507 new cases of cancer detected throughout Malaysia was breast cancer. The current treatments available are chemotherapy and hormone therapy using tamoxifen. However, it causes some side effects, which includes extreme fatigue, loss appetite, and depression. Therefore, there is a need for more targeted and less side-effect anti-cancer drug. Substituted Schiff bases are well known for their profound anticancer activity[11].

This article reports the efficient synthesis of the mentioned nitrogen containing heterocycles using ethanol as a solvent by a conventional synthetic route. Along with routine spectroscopic studies to ascertain the structure, an attempt to obtain single-crystals of as many compounds as possible in order to understand structural features, bond length, bond angles and atomic spacing are presented. Molecular docking studies were carried out to identify the potential binding affinities and the mode of interaction of the compounds against protein 4OD9.

Chemistry

The general schematic representation describing the routes of syntheses is furnished in Scheme 1. (1E,4E)-1,5-diphenylpenta-1,4-dien-3-one were prepared by the condensation reaction of benzaldehyde with respective ketones in the presence of sodium hydroxide in Water/ ethanol medium stirred for 4hrs. N-[(1E,4E)-1,5-bis(2,6-dichloro-4-methylphenyl)penta-1,4-dien-3-ylidene-1-(2-chlorophenyl)methanamine are synthesized by refluxing (1E,4E)-1,5-diphenylpenta-1,4-dien-3-one with respective (2-chlorophenyl)methanamine in the presence of sodium hydroxide in ethanol medium for 24 h. All the synthesized compounds were characterized by analytical and spectral (Mass, IR, 1H and NMR) data. The physical and analytical data of the Schiff bases (2a-i) are presented in Table 1. The stereochemistry of all the synthesized Schiff bases are established using 1H NMR spectral data.

1-(2-chlorophenyl)-N-((1E,4E)-1,5-diphenylpenta-1,4-dien-3-ylidene)methanamine(2a)

Yield-87%, m.p-77-79°C, 1H NMR- δ 2.2-2.5 (s, methylene proton), 4.5-5.7 (d, ethylene proton), 6.05-6.75 (d, ethylene proton), 6.85-7.90 (m, aromatic proton), 13C NMR- δ 55.30 (methyl carbon), 127.66, 127.89, 128.13, 128.56, 128.78, 129.48, 129.90, 130.57, 130.77, 132.71, 134.54 (aromatic carbons), 159.40 (CN carbon), IR(KBR)-1654, 1604, 870 cm⁻¹, Mass (m/z)-357.13.

N-((1E,4E)-1,5-bis(2,6-dichloro-4-methylphenyl)penta-1,4-dien-3-ylidene)-1-(2-chlorophenyl)methanamine(2b)

Yield-87%, m.p-71-73°C, 1H NMR- δ 2.1-2.6 (s, methylene proton), 3.6-3.9 (s, methoxy proton), 4.6-5.8 (d, ethylene proton), 6.01-6.70 (d, ethylene proton), 6.80-8.10 (m, aromatic proton), 13C NMR- δ 55.38 (methyl carbon), 61.71 (methoxy carbon), 127.63, 127.88, 128.04, 128.67, 128.83, 129.38, 129.70, 130.38, 130.77, 132.91, 134.63 (aromatic carbons), 159.42 (CN carbon), IR(KBR)-1654, 1200, 1604 cm⁻¹, Mass (m/e)-521.00.

N-((1E,4E)-1,5-bis(4-methoxyphenyl)penta-1,4-dien-3-ylidene)-1-(2-chlorophenyl)methanamine(2c)

Yield-88%, m.p-76-78°C, 1H NMR- δ 2.1-2.6 (s, methylene proton), 3.6-3.9 (s, methoxy proton), 4.6-5.8 (d, ethylene proton), 6.01-6.70 (d, ethylene proton), 6.80-8.10 (m, aromatic proton), 13C NMR- δ 55.38 (methyl carbon), 61.71 (methoxy carbon), 127.63, 127.88, 128.04, 128.67, 128.83, 129.38, 129.70, 130.38, 130.77, 132.91, 134.63 (aromatic carbons), 159.42 (CN carbon), IR(KBR)-1654, 1200, 1604 cm⁻¹, Mass (m/z)-417.15.
1-(2-chlorophenyl)-N-((1E,4E)-1,5-di-p-tolylpenta-1,4-dien-3-ylidene)methanamine(2d)

Yield-87%, m.p-73-75° C, \(^1\)H NMR- δ 2.5-2.8 (s,methylene proton), 3.1-3.3 (s,methyl proton), 4.7-5.8 (d,ethylene proton), 6.13-6.89 (d,ethylene proton), 6.98-8.09 (m,aromatic proton), \(^{13}\)C NMR-55.30 (methyl carbon), 127.60, 127.78, 128.24, 128.57, 128.83, 129.57, 129.78, 130.40, 130.78, 132.4, 134.73 (aromatic carbons), 159.32 (CN carbon), IR(KBR)-1654, 1200, 1604, 870 cm\(^{-1}\), Mass (m/z)-537.19.

N-((1E,4E)-1,5-bis(2,4-dimethylphenyl)penta-1,4-dien-3-ylidene)-1-(2 chlorophenyl)methanamine(2e)

Yield-89%, m.p-78-80° C, \(^1\)H NMR- δ 2.7-2.9 (s,methylene proton), 3.2-3.6 (s, methyl proton), 4.5-5.9 (d,ethylene proton), 6.25-6.78 (d,ethylene proton), 6.98-8.09 (m, aromatic proton), \(^{13}\)C NMR-55.40 (methyl carbon), 127.59, 127.57, 128.33, 128.59, 128.88, 129.37, 129.57, 130.45, 130.67, 132.39, 134.65 (aromatic carbons), 159.42 (CN carbon), IR(KBR)-1210, 1624, 860 cm\(^{-1}\), Mass (m/z)-385.16.

N-((1E,4E)-1,5-bis(4-bromo-2-nitrophenyl)penta-1,4-dien-3-ylidene)-1-(2 chlorophenyl)methanamine(2f)

Yield-88%, m.p-78-80° C, \(^1\)H NMR- δ 2.5-2.8 (s, methylene proton), 4.1-5.3 (d, ethylene proton), 6.05-6.68 (d, ethylene proton), 6.89-8.23 (m, aromatic proton), \(^{13}\)C NMR-55.5 (methyl carbon), 127.58, 127.36, 128.57, 128.65, 128.80, 129.54, 129.87, 130.27, 130.45, 130.67, 132.83, 134.72 (aromatic carbons), 159.39 (CN carbon), IR(KBR)-1211, 1624, 1450, 913 cm\(^{-1}\), Mass (m/e)-413.19.

N-((1E,4E)-1,5-bis(3,4,5-trimethoxyphenyl)penta-1,4-dien-3-ylidene)-1-(2 chlorophenyl)methanamine(2g)

Yield-89%, m.p-77-79° C, \(^1\)H NMR- δ 2.1-2.7 (s, methylene proton), 3.6-3.9 (s, methoxy proton), 4.6-5.8 (d, ethylene proton), 6.05-6.65 (d, ethylene proton), 6.91-8.109 (m, aromatic proton), \(^{13}\)C NMR-55.40 (methyl carbon), 61.69 (methoxy carbon), 127.53, 127.92, 128.24, 128.51, 128.96, 129.03, 129.85, 130.45, 130.87, 133.30, 134.83 (aromatic carbons), 159.52 (CN carbon), IR(KBR)-2830, 1654, 1200, 1604, 872 cm\(^{-1}\), Mass (m/z)-602.92.

1-(2-chlorophenyl)-N-((1E,4E)-1,5-di(pyridine-3-yl)penta-1,4-dien-3-ylidene)methanamine(2h)

Yield-88%, m.p-76-78° C, \(^1\)H NMR- δ 2.21-2.53 (s, methylene proton), 4.7-5.69 (d, ethylene proton), 6.15-6.64 (d, ethylene proton), 6.85-7.90 (m, aromatic proton), \(^{13}\)C NMR-855.35 (methyl carbon), 127.43, 127.53, 128.10, 128.44, 128.80, 129.48, 129.90, 130.5
7,130.77,132.60,134594 (aromatic carbons), 159.39(CN carbon), IR(KBR)-1644,1624,869 cm⁻¹, Mass (m/z)-359.12.

1-(2-chlorophenyl)-N-[(1E,4E)-1,5-di(thiophen-3-yl)penta-1,4-dien-3-ylidene)methanamine(2i)

Yield-87%, m.p-77-79⁰ C, ¹H NMR- δ 2.2-2.5 (s,methylene proton), 4.5-5.7 (d,ethylene proton), 6.05-6.75(d,ethylene proton), 6.85-7.90(m,aromatic proton), ¹³C NMR-δ55.30(methyl carbon), 127.66, 127.89, 128.13, 128.56, 128.78, 129.48, 129.90, 130.5, 130.77, 132.71, 134.54 (aromatic carbons), 159.40(CN carbon), IR(KBR)-1654,1604,870 cm⁻¹, Mass (m/e)-369.04.

Molecular docking studies

Computational section
Docking Studies

The docking studies of the above 9 compounds with the protein have been carried out by the application LIGAND DOCKING in the module GLIDE of SCHRODINGER software. By the help of this tool we can predict the best binding interaction between the ligand and the protein. Creating an output directory for every work is a must while working in Schrodinger. Before initiating the ligand preparation, the structures have to be converted into maestro format (.mae format) from .mol format. The structures of the 9 compounds have been drawn with the help of the, CHEMDRAW ULTRA 12.0 tool. Each structure has been imported into the MAESTRO 21. from the project table and are then exported from the mol format to the .mae format.

Ligand and protein preparation

Ligand Preparation

Ligand Preparation LigPrep or ligand preparation is an application where we generate a simple 2D structure to 3D structure which includes the generation of the tautomeric, stereochemical and ionization variations. LigPrep helps in generating an accurate 3D molecular model. The important characteristic of LigPrep application is the energy minimization with optimized potentials for liquid simulations-2005 (OPLS_2005) as the applied force field which filters customized ligands which can thus be used for further computational analysis. All the 18 ligands have been minimized using Schrödinger suite, whose corresponding results are given in the table 1. The output folder for LigPrep will be displayed as out.maegz [12].

Impact Minimization

The output folder of LigPrep is used as the input folder for impact minimization. The impact minimization is performed with the help of IMPACT module in which we have a tool called minimization. Among many conformers obtained in the LigPrep, the conformer with least potential energy will be minimized with the help
of impact minimization under the applied OPLS_2005 force field. The significance of impact minimization is to observe the Lennard Jones Energy, which should be in negative [13].

**Protein Preparation**

The protein was retrieved from PDB (http://www.pdb.org) with the PDB id 4OD9. The ProPrep was processed with the help of the protein preparation wizard from the workflows option of the Schrodinger suite. The force field applied for the preparation of the protein is optimized potentials for liquid simulations-2005 (OPLS_2005). The water molecules, hetero atoms, residues were deleted while one of the chains is retained along with H-bond. The active site of the protein is identified by the help of PDBCASTp and Q-site finder [14].

**Grid Generation**

The receptor-grid is generated by the help of the module glide. Grid generation represents the physical properties like volume of the receptor (specifically the active site) that is needed for carrying out the ligand-docking process. Import the output file of the protein preparation; also define the receptor, active site, the positional constraints, and then monitor the generation of the grid calculation. The generated receptor grid is used for the comparative docking studies conducted in ligand docking procedure[15].

**Docking**

The docking has been carried out by the application LIGAND DOCKING which is present in the module GLIDE12.1 version in the extra precision (XP) mode for clear and accurate details along with Epik state penalties to docking score. Select the selected entries for the ligand to be docked. Also load the output file of the grid generated. The output files of impact minimization of all the compounds are taken as the input files for the docking process. The docking of each compound along with the grid will be carried out which generates conformational changes with respect to the active site of the protein(PDB ID- 4OD9). The glide scores or docking scores will be displayed in a text document. Thus, the ligand which has the least glide score will be considered to have the best docked pose or best glide score.

**Result and Discussion**

Molecular docking is a tool used in computer aided structure based rational drug design. It is designed to predict how a small molecule binds to a target protein with known 3D structure, and binding energies determined. Also the position of the ligand in the hosts binding site can be visualized. It is helpful for developing better drug with improved activity. The docking score is measure of strength of the non-covalent interaction or binding affinity between two molecules after they have been docked[16-18]. In calculating the docking score, the small organic molecule or ligand is considered as a rigid structure and its interactions with protein receptors are recorded and expressed in terms of energy associated with such interactions. In calculations of the Glide energy value, the conformational,
orientational, and positional space of the docked ligand are taken into consideration [19-20]. Thus, the Glide energy value is obtained with torsionally flexible energy optimization where the ligand is a flexible entity and all its possible geometrical orientations are considered. Hence, the Glide energy value is a more reliable, enhanced, and realistic approach to investigate the docking process. Both docking score or docking and Glide energy are free energy values and expressed in kcal mol$^{-1}$. All the synthesized compounds exhibited good Glide energy and docking scores towards the receptor active pocket, and bind to the active site of the amino acid residue with H-bonding very close to the standard drug Capecitabine (Table 7). Compound 2e showed the highest docking score and a Glide energy lower than that of standard doxorubicin. Its hydrogen bonding distances to amino acids VAL31 and HIS56 are comparatively shorter compared to those found in Capecitabine. Compound 2e can be considered to be the best docked ligand with the highest docking score and lowest Glide energy. The compounds 2h,2a showed docking scores very close to the standard drug, but Glide energies were found to be comparatively lower. Compounds 2b,2c,2d,2f,2g,2i have moderate docking scores and Glide energies. In this study compound 2e showed the shortest hydrogen bonding distance of 1.85 Å, 2.44 Å with the amino acid likely due to presence of the more electronegative atom. Docking score results shown in table 2 and interaction of the compounds shown fig(1-4).

HOMO-LUMO

The energy levels of the molecular orbitals order HOMO and LUMO IIs give information on the possible electronic transition. The HOMO and LUMO also indicate the electrophilic and nucleophilic attraction region in molecule shown in Figure 4. The LUMO-HOMO gap is the most important parameter for the chemical reactivity. The shorter LUMO- HOMO gap is considered as the high reactivity.

**Chemical reactivity by DFT calculations**

The Energy of the HOMO is directly related to the ionization potential and LUMO Energy is directly related to the electron affinity. Energy difference between HOMO and LUMO orbital is called as energy gap which is an important parameter that determines the stability of the structures. The energy gap is used in determining molecular electrical transport properties. In addition, according to Koopmans’ theorem the energy gap, E gap, defined as the difference between HOMO and LUMO energy [37].

\[ \text{Egap} = (\text{ELUMO} - \text{E_{HOMO}}) \approx \text{IP} - \text{EA} \]

The ionization potential (I) and electron affinity (A) can be estimated from the HOMO and LUMO energy values as following equation no 1 and 2. The data of HOMO, LUMO gap, ionization potential, and electron affinity are given in Table 4.

\[ I = -E_{HOMO} \quad \ldots (1) \]
\[ A = E_{LUMO} \quad \ldots (2) \]

The HOMO and LUMO energies are used for the determination of global reactivity descriptors. It is important that electro-piilicity (ω), chemical potential (μ), electro-negativity (ξ), hardness (η) and softness (S) be put into a molecular
orbital’s framework [38]. We focus on the HOMO and LUMO energies in order to
determine the interesting molecular/atomic properties and chemical quantities.
These are calculated as following equations given in Table 5.

\[
\mu = -I + A/2 \quad \ldots \quad (3)
\]

\[
\eta = I - A/2 \quad \ldots \quad (4)
\]

\[
S = 1/\eta \quad \ldots \quad (5)
\]

\[
\chi = I + A/2 \quad \ldots \quad (6)
\]

\[
\omega = \mu^2/2\eta \quad \ldots \quad (7)
\]

**Thermo physical properties**

The binding free energy of the optimized molecules is calculated by performing
docking process. The molecule with minimum binding energy will have the
maximum binding affinity. The binding free energy of the designed molecules is
obtained by eliminating the energy of the main molecule. Having the maximum
binding affinity, indicating as the best molecule for drug leads molecules targeting
computationally. We can find out the drug binding affinity by using the fitness of
the drug, which can bind to the target molecule during the docking process and
the second way is using Gibbs free energy calculations. According to this more
negative value, we can consider a more effective drug. The thermo-physical
properties like total energy, entropy, free energy, enthalpy, are provided Table 6.

**Table 6. Thermophysical Properties**

**Conclusion**

The synthesized compounds were characterized by \(^1\)H NMR, \(^{13}\)C NMR,IR and Mass
spectral analysis. The results obtained from this study confirmed the product
Schiff bases were formed. Henceforth viewing these characteristic properties, all
the compounds have variety of biological activity viz., antimicrobial, antifungal, antinflammatory and anticancer, etc. To sum up, it is concluded that the biological chemistry, chemical reactivity and molecular orbital study like QSAR, HOMO, LUMO, HOMO-LUMO gap, ionization potential, electron affinity, and electrostatic potential in case of the charge distribution in molecule were optimized. From the data it is found that all pyrazole derivatives show highly bioactivity. From docking studies compound 2f showes highly active for breast cancer.
